

## Comparison of Advantages and Disadvantages of Treatments Hooked on to the SCIO and Treatment done in Subspace

Individual Treatment with client hooked up to the SCIO device	Individual Treatment in Subspace	Group Treatment in Subspace
Testing is focused on the individual and the SCIO device provides feedback on an individual basis.	Testing is focused on the individual and the SCIO device provides feedback on an individual basis.	Testing is focused on the group and the SCIO device provides feedback on the group's needs. The testing therefore provide an average per individual of the group. A intelligence grouping of individuals with similar needs will however address relevant needs.
Client's individual requirements can be addressed.	Client's individual requirements can be addressed.	Group's requirements are addressed. With the correct grouping of the treatments are done which will benefit the group. The "average" requirement of the group is addressed.
During the treatment the therapist can provide one-on-one continuous feedback on finding and progress, and can provide health information throughout the session.	Verbal feedback to the individual needs to be done before, during and after the session. This needs to be done by telephone or e-mail.	The individuals or the group will be notified in advance by e-mail or SMS on when the session will take place. After the session each individual of the group will be notified on the progress of the group as a whole.
The client needs to arrange a appointment with the clinic for a suitable time to do the treatment.	The treatment can be done while the client is at home or elsewhere.	A scheduled treatment is done after notification to each group member.
The client needs to travel to the clinic for the treatment to be done.	Travelling time, risk and expenses are eliminated.	Travelling time, risk and expenses are eliminated.
Individual treatments are more expensive than group treatments.	A small additional administration cost is required for additional communication per telephone and additional time to give feedback after the treatment.	Group treatments are more cost effective when compared to individual treatments.

Individual treatments are normally done every two weeks due to logistics and cost constraints. For acute requirements treatments can however be done every third day.	Individual treatments are normally done every two weeks due to logistics and cost constraints. For acute requirements treatments can however be done every third day.	Group treatment are normally done once per week. Lower cost and less logistics constraint allow for more frequent treatments.
Certain treatments that require a direct connection to the SCIO device via the point probe or specialised harness can only be done as an individual treatment in the consulting room. This includes stem cell stimulation and beauty related treatments such as varicose vein removal, scar, wart and spot removal, breast enlargement/reduction, etc.	Certain treatments that require a direct connection to the SCIO device via the point probe or specialised harness cannot be done in subspace.	Treatment on groups exclude treatment that cannot be done in subspace.
